

A common issue experienced by industrial computing users is the inability to read a display when viewed in bright sunlight. Using a variety of techniques, **APC Technology** is solving problems for end users to enable them to view displays in any light condition.

In the past the solution was to utilise commonly found hi bright displays to overcome this issue in application. The downside was a requirement for additional luminescence of backlighting which in turn caused the need for increased power consumption and heat generation as commonly found when operating traditional hi bright displays. The following technology solutions offer the ability for optimised enhanced viewing capabilities within applications where a high level of environmental light is present.

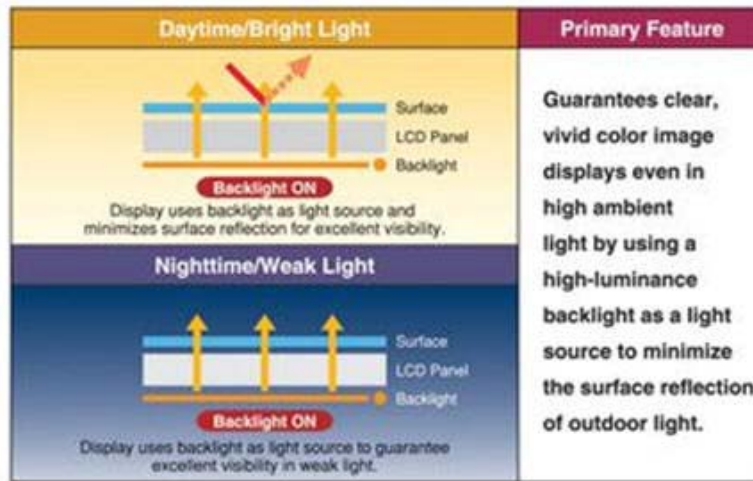

The function is performed without the drawbacks associated with the use of traditional hi bright displays.

Technology options include:

OPTICAL BONDING - Sunlight Readability and Optical Clarity

TRANSFLECTIVE DISPLAY

These are just two solutions available for your application requirements.

APC Technology: *Continually discovering new and better solutions for tomorrows applications today*

“We continually liaise with the customer at all stages to ensure that performance requirements are met and that any solution provided by APC remains relevant”

APC TECHNOLOGY SOLUTIONS

Real World Solutions

Cobham plc ('Cobham') has delivered the tenth and final new border patrol surveillance aircraft to the Australian Border Protection Command, under the AUS\$1 billion, 12 year Sentinel project. Federal Minister for Home Affairs, the Hon. Bob Debus, accepted the aircraft in a ceremony at Adelaide Airport, in the presence of senior Border Protection Command personnel, project partners and Cobham employees.

Each of the ten aircraft will be capable of searching an area of more than 110,000 square kilometres per flight using new generation surveillance sensors and advanced satellite communications systems. Each aircraft will also act as a live link in a national data communications chain, with the customer receiving a stream of timely, high quality surveillance information, enabling them to make informed border security decisions in real time.
